Answer: ADG. a. TRUE - Physicists often speak of conventional current as the direction that positive charge moves through a circuit. This is based on the convention that the direction of the electric field is the direction that a + test charge would be accelerated.

Electric Circuits Review - Answers

Answer: DF. For a circuit to be established, there must be a closed conducting loop from the positive terminal to the negative terminal. This would mean that circuits D, E and F would all be circuits. But in order for the light bulb to light, it must be included as part of the electric circuit.

Electric Circuits Review - Answers #2

Answer: See answers above. a. - c. Location A is outside or before the branching locations; it represents a location where the total circuit current is measured. This current will ultimately divide into three pathways, with each pathway carrying the same current (since each pathway has the same resistance).

Electric Circuits Review - Answers #4

D2-WWT02 Answer: The statement is incorrect, because the arrangement of the batteries determines the brightness of the bulbs and not the number of bulbs. The circuits in cases A, D, and E have the batteries connected in parallel with each other so the potential difference across the bulb in these cases is the voltage of a single battery. Thus the current in the bulb, and consequently the ...

product of the current in a circuit and the resistance in the circuit is a constant. A graph of current as a function of resistance in a circuit produces a hyperbolic curve. 19. The current in a circuit is dependent upon the voltage. Doubling the voltage in a circuit doubles the current. 20. voltage; resistance 21. Answers are: a.

Chapter 13 Review Answer Key - northernhighlands.org

Answer: See answers above. In an electric circuit, the electric potential for a moving charge is gained in the battery and lost in a light bulb (or some resistor found in the external circuit). So the electric potential of a charge is the same for any two points which are not separated by a battery or by a light bulb.

Total voltage is same in all branches of the circuit. Currents in each path add to current from the battery; Path with the least resistance gets most current; A break in one path has no effect on the other paths. Fuses, resistors and switches will do nothing if they are connected in a path that does not contain the thing they are intended to ...
