MAE 20 Winter 2011 Assignment 3 solutions 4.3 Calculate the activation energy for vacancy formation in aluminum, given that the equilibrium number of vacancies at 500°C (773 K) is  $7.57 \times 10^{23} \text{ m}^{-3}$ . The atomic weight and density (at 500°C) for aluminum are, respectively, 26.98 g/mol and 2.62 g/cm<sup>3</sup>. Solution

Assignment 3, solutions Problem 1: A stationary space station can be approximated as a hollow spherical shell of mass 6 tons (6000 kg) and inner and outer radii of 5 m and 6 m. To change its orientation, a uniform fly wheel of radius 10 cm and mass 10 kg located at the center of the station is spun quickly from rest to 1000 rpm.

Solution:Note. As was mentioned by some students in class, this problem does not seem to have a solution without an appeal to the mean value theorem (MVT), which we of course did not cover last week. Below is the most canonical attempt towards a solution, and you will see the point at which I dont think one can proceed without MVT.

Math 334 Assignment 3 — Solutions 4 6. Consider the differential equation  $y'' - \lambda^2 y = 0$ , where  $\lambda$  is a positive constant. (a) Show that the general solution can be written in the form  $c_1 e^{\lambda x} + c_2 e^{-\lambda x}$ . (b) Show that the general solution can also be written in the form  $a_1 \cosh \lambda x + a_2 \sinh \lambda x$ .
