Bayesian analysis is a statistical procedure which endeavors to estimate parameters of an underlying distribution based on the observed distribution. Begin with a "prior distribution" which may be based on anything, including an assessment of the relative likelihoods of parameters or the results of non-Bayesian observations. In practice, it is common to assume a uniform distribution over the ...

In statistics, sequential analysis or sequential hypothesis testing is statistical analysis where the sample size is not fixed in advance. Instead data are evaluated as they are collected, and further sampling is stopped in accordance with a pre-defined stopping rule as soon as significant results are observed. Thus a conclusion may sometimes be reached at a much earlier stage than would be ...

Dynamic Bayesian networks. Other recent variations on the traditional BN modeling theme include dynamic Bayesian networks (DBNs) that model a time series of conditions and contingencies, such as with oscillating predator-prey dynamics ().DBNs typically contain feedback loops which are not allowed in the directed acyclic graph structure of BNs, but can be modeled when BNs are time-expanded so ...
