In calculus, the indefinite integral of a given function (i.e., the set of all antiderivatives of the function) on a connected domain is only defined up to an additive constant, the constant of integration. This constant expresses an ambiguity inherent in the construction of antiderivatives. If a function $f(x)$ is defined on an interval and $F(x)$ is an antiderivative of $f(x)$, then the set of all ...

Constant of integration - Wikipedia

Linearity is the property of a mathematical relationship or function which means that it can be graphically represented as a straight line. Examples are the relationship of voltage and current across a resistor $V = IR$, or the mass and weight of an object. Proportionality implies linearity, but linearity does not imply proportionality.
