Methane, which has a high energy storage density and is safely stored and transported in our existing infrastructure, can be produced through conversion of the undesired energy carrier H_2 with CO_2 . Methane production with standard transition-metal catalysts requires high-temperature activation (300–500 °C). Alternatively, semiconductor metal oxide photocatalysts can be used, but they ...

In this section we briefly present the standard approaches used to model supported ZN catalysts, with advantages and limitations. Before starting, we recall that the most recent view of industrially used $MgCl_2$ supported ZN-catalysts is that they consist of small $MgCl_2$ particles that can probably break during the polymerization process, reducing further the average dimension of the $MgCl_2$...
