Cancer Stem Cells. What is a stem cell? A stem cell is a special cell type that has both the ability to reproduce exact copies of itself (also called self-renewal) and the ability to change (differentiate) into one of the many specialized cell types in the body. Examples of specialized cells that arise from stem cells include nerves, muscles and the cells lining our digestive system.

Cancer is a group of diseases involving abnormal cell growth with the potential to invade or spread to other parts of the body. These contrast with benign tumors, which do not spread. Possible signs and symptoms include a lump, abnormal bleeding, prolonged cough, unexplained weight loss and a change in bowel movements. While these symptoms may indicate cancer, they can also have other causes.

### **Cancer - Wikipedia**

Metastasis is a pathogenic agent's spread from an initial or primary site to a different or secondary site within the host's body; it is typically spoken of as such spread by a cancerous tumor. The newly pathological sites, then, are metastases (mets). It is generally distinguished from cancer invasion, which is the direct extension and penetration by cancer cells into neighboring tissues.

miRNA profiling studies have led to the identification of miRNAs that are aberrantly expressed in human breast cancer, with miR-10b, miR-125b and miR-145 being down-regulated and miR-21, and miR-155 being up-regulated.

### **miRNA Biomarkers in Breast Cancer Detection and Management**

Ductal carcinoma in situ (DCIS) is an intraductal neoplastic proliferation of epithelial cells that is separated from the breast stroma by an intact layer of basement membrane and myoepithelial cells. DCIS is a non-obligate precursor of invasive breast cancer, and up to 40% of these lesions progress to invasive disease if untreated.

2. (b): The term evolution was coined by Herbert Spencer, an English philosopher which means unrolling or unfolding of nature that brings about an orderly change from one form or condition to another resulting in descendents becoming different from ancestors. Thus, it is history and development of race along with variations. 3. "Continuity of germplasm" theory was given by

In addition to the finding that suppression of global MiRNA biogenesis induces p53/p21 signaling and senescence, individual MiRNAs have been identified that control the expression levels of protein components of this pathway (Jones and Lal, 2012, Mudhasani et al., 2008). Specifically, we will focus on the SA-MicroRNAs that regulate expression of p53, p21, MDM2, SIRT1, MYC, TERT, and MCD1 ().

Colon cancer is a well-known feature of familial polyposis coli. Cancer of the colon occurred in 7 members of 4 successive generations of the family reported by Kluge (1964), leading him to suggest a simple genetic basis for colonic cancer independent of polyposis. The combination of colonic and endometrial cancer has been observed in many families (e.g., Williams, 1978).
