an inherited metabolic disorder in which there are abnormally high blood sugar levels. In advanced stages, this often results in blindness from cataracts, nerve damage, gangrene in the feet and legs leading to amputation, heart disease, and kidney failure. Type 1 diabetes mellitus (juvenile onset diabetes) is due to decreased production of insulin by the pancreas.

There are about 1,098 human X-linked genes. Most of them code for something other than female anatomical traits. Many of the non-sex determining X-linked genes are responsible for abnormal conditions such as hemophilia, Duchenne muscular dystrophy, fragile-X syndrome, some high blood pressure, congenital night blindness, G6PD deficiency, and the most common human genetic disorder, red-green ...

The basic laws of inheritance are important because they can reveal how a genetic trait of interest or a disorder can be passed from generation to generation. Each person has 22 pairs of chromosomes. For each pair of chromosomes, one comes from the mother and one comes from the father.

When people clasp their hands, almost all have a strong preference; either the right thumb is on top (R) or the left thumb is on top (L). Hand-clasping is sometimes used to illustrate basic genetics; the myth is that hand-clasping is controlled by one gene with two alleles, and the allele for L is dominant.

General practice covered workers under Lloyd George's National Insurance Act of 1911, but not their wives and families, whose proper demands were curtailed by the need to pay fees for service. 2 When they were sick, it was the GP to whom people wished to turn. The work of the GP had been described in idealistic terms by Lord Dawson in his report of 1920, which laid out the structure a health ...
