In mathematics, an ordinary differential equation (ODE) is a differential equation containing one or more functions of one independent variable and the derivatives of those functions. The term ordinary is used in contrast with the term partial differential equation which may be with respect to more than one independent variable.

Ordinary differential equation - Wikipedia

A differential equation can be homogeneous in either of two respects.. A first order differential equation is said to be homogeneous if it may be written $(.) = (.)$, where f and g are homogeneous functions of the same degree of x and y . In this case, the change of variable $y = ux$ leads to an equation of the form $= (.)$, which is easy to solve by integration of the two members.
