DNA is a long polymer made from repeating units called nucleotides. The structure of DNA is dynamic along its length, being capable of coiling into tight loops and other shapes. In all species it is composed of two helical chains, bound to each other by hydrogen bonds. Both chains are coiled around the same axis, and have the same pitch of 34 angstroms (Å) (3.4 nanometres).

6.1 Introduction. DNA analysis is, after immunofluorescence, the second most important application of flow cytometry. By measuring the DNA content of individual cells, we obtain information about their ploidy (see Section 6.3), of particular relevance in tumours, and, for a population, the distribution of cells across the cell cycle. The relationship between the DNA histogram and the cell cycle ...

DNA polymerases are a family of enzymes that carry out all forms of DNA replication. DNA polymerases in general cannot initiate synthesis of new strands, but can only extend an existing DNA or RNA strand paired with a template strand.

DNA replication - Wikipedia

Unlike DNA viruses, viruses with RNA genomes do not usually enter the nucleus of an infected cell. Because they do not have a DNA intermediate, none of the host enzymes involved in DNA replication are required for the replication of the RNA genome.

In order to properly clean your DNA, RNA or protein sequence we need to know which alphabet the sequence is using. For instance "N" will be stripped out if you select a strict DNA alphabet, while it will remain if you select a IUPC ambiguous alphabet, where N exists and means "any nucleotide".

Hemagglutination. Hemagglutination is easy to test for in the clinical laboratory and is used in diagnosis . Hemagglutination involves the agglutination of red blood cells and relies on the ability of a virus to bind to receptors on red blood cells. Since viruses have multiple attachment proteins per virion, they can bind to more than one red blood cell and so they can serve to link red blood ...
