In numerical analysis, numerical differentiation describes algorithms for estimating the derivative of a mathematical function or function subroutine using values of the function and perhaps other knowledge about the function.

The make or buy decision involves whether to manufacture a product in-house or to purchase it from a third party. The outcome of this analysis should be a decision that maximizes the long-term financial outcome for a company. There are a number of factors to consider when making this decision, inclu

Results. 197 countries were included in the analysis, covering 98.7% of the world's population. The overall economic cost of HF in 2012 was estimated at \$108 billion per annum. Direct costs accounted for ~ 60% (\$65 billion) and indirect costs accounted for ~ 40% (\$43 billion) of the overall spend. Heart failure spending varied widely between high-income and middle and low-income countries.

Numerical representations of the severity of health loss associated with a health state. Derived from a worldwide, cross-cultural study to compare the relative severity of health problems, disability weights are numbers between 0 and 1 that are multiplied by the time spent living with a health loss to determine the years lived with disability associated with the cause of that loss.

In numerical analysis, fixed-point iteration is a method of computing fixed points of iterated functions.. More specifically, given a function defined on the real numbers with real values and given a point in the domain of , the fixed point iteration is $x_{n+1} = f(x_n)$, $x_0 = x$, ... which gives rise to the sequence x_0, x_1, x_2, \dots which is hoped to converge to a point x^* . If f is continuous, then one can prove that the ...
