In physics, motion is the change in position of an object with respect to its surroundings in a given interval of time. Motion is mathematically described in terms of displacement, distance, velocity, acceleration, and speed. Motion of a body is observed by attaching a frame of reference to an observer and measuring the change in position of the body relative to that frame.

In physics, a rigid body (also known as rigid object) is a solid body in which deformation is zero or so small it can be neglected. The distance between any two given points on a rigid body remains constant in time regardless of external forces exerted on it. A rigid body is usually considered as a continuous distribution of mass. In the study of special relativity, a perfectly rigid body does ...

It is the precision of the volume of fluid (for each foot) and the mechanical action that separates the Silicone Dynamic Orthotic from any orthotic. It matches the way the foot walks-precisely. All orthotics have a stationary support. This actually interferes with the motion and momentum of the arch. Even a semi-flexible support, the motion is only "up and down"-- and it's not precise.
