Biochemistry Jeremy M Berg

Paul Berg (born June 30, 1926) is an American biochemist and professor emeritus at Stanford University. He was the recipient of the Nobel Prize in Chemistry in 1980, along with Walter Gilbert and Frederick Sanger. The award recognized their contributions to basic research involving nucleic acids. Berg received his undergraduate education at Penn State University, where he majored in biochemistry.

Early life and education Early years. Jennifer Doudna was born February 19, 1964 in Washington, D.C. Her father received his Ph.D. in English literature from the University of Michigan, and her mother, a stay-at-home parent, held a master's degree in education. When Doudna was seven years old, the family moved to Hawaii because her father accepted a position in American literature at the ...

Phospholipids are an important class of biomolecules. Phospholipids are the fundamental building blocks of cellular membranes and are the major part of surfactant, the film that occupies the air/liquid interfaces in the lung. These molecules consist of a polar or charged head group and a pair of nonpolar fatty acid tails, connected via a glycerol linkage.

DNA-replikation er en biokemisk proces, der kopierer DNA'et i en celle. Processen finder sted i cellekernen hos eukaryoter og i cytoplasma hos prokaryoter. Den er en forudsætning for, at der efterfølgende kan ske en vellykket celledeling, da hver dattercelle har brug for et komplet sæt DNA for at kunne fungere. DNA replikeres semi-konservativt, hvilket betyder, at når ét DNA-molekyle er ...

Ligasen (lateinisch ligare "verbinden", "verketten") sind Enzyme der sechsten Enzymklasse laut der systematischen Nomenklatur der Enzymkommission der International Union of Biochemistry (IUB), die das Verknüpfen zweier Moleküle durch eine kovalente Bindung katalysieren.. Dazu benötigen sie Energie, die aus der Spaltung energiereicher Nukleosidtriphosphate (NTP) wie ...

The Krebs cycle is a series of enzymatic reactions that catalyzes the aerobic metabolism of fuel molecules to carbon dioxide and water, thereby generating energy for the production of adenosine triphosphate (ATP) molecules. The Krebs cycle is so named because much of its elucidation was the work of the British biochemist Hans Krebs.

Proteasen of peptidasen zijn enzymen die in de afbraak van eiwitten en andere ketens van

aminozuren katalyseren.Proteasen verbreken de peptidebindingen tussen twee aminozuren door middel van het toevoegen van een watermolecuul: hydrolyse.Hydrolyse van eiwitten wordt proteolyse genoemd. Er kan onderscheid gemaakt worden tussen endoproteasen en exoproteasen.

Das Euchromatin stellt die Bereiche des aufgelockerten Chromatingerüsts im Karyoplasma einer Zelle dar. Im Gegensatz zum Heterochromatin liegt die Desoxyribonucleinsäure (DNA) hier in weniger dicht gepackter Form vor. Im Euchromatin befinden sich die meisten Gene und fast die gesamte Genaktivität. Zum Teil sind hier die Doppelstränge der DNA durch Enzyme zu parallelen Einzelsträngen ...

La fosforilazione ossidativa è rimasta un mistero fino agli inizi degli anni '60 ed è grazie al biochimico inglese Peter D. Mitchell (e a successivi ricercatori) se ora conosciamo questo processo fino a questo punto.. Proprio grazie a questa ricerca Mitchell fu insignito del Premio Nobel per la chimica nel 1978..
