Log-linear analysis is a technique used in statistics to examine the relationship between more than two categorical variables.The technique is used for both hypothesis testing and model building. In both these uses, models are tested to find the most parsimonious (i.e., least complex) model that best accounts for the variance in the observed frequencies.

Activity-Based travel demand modeling requires the detailed socioeconomic data of the study area population. Since the collection of such detailed data for the whole population is too expensive, if not infeasible, population synthesis has been proposed to predict the data and produce them synthetically based on a sample.
